Machine Learning Project 22-23

Reza Gonabadi Zeinab Mohammadpour

· First of all, We should import most needed library and package:

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.metrics import f1_score
from sklearn.model_selection import train_test_split
# During the project we will add some necessary library
```

· Our dataset is in the CSV format and we use pandas function like read_csv to import data to our environment

• The basic things we should do are knowing about size of our data

```
data.shape (3000, 16)
```

• As you can see we have 3000 rows which shows number of sample and 16 columns which shows features and labels of classes; the next stepshould describe our data, what are our features and labels names and how they present in the dataset*

Exploratory Data Analysis

#gives information about the data types,columns, null value counts, memory usage etc
data.info(verbose=True)

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3000 entries, 0 to 2999
Data columns (total 16 columns):

- those two function (isna().sum(), info) show us number of null features in the dataset and the last function present dataset in rows and columns, so because the number of diameter feature has too much null number it would be better to remove this feature from our dataset and work with others*
- In the section below we remove column 'diameter' from our dataset*

```
data.drop(['diameter'], axis = 1, inplace=True)
tyres_test.drop(['diameter'], axis = 1, inplace=True)
```

As you can see, the diameter feature was removed data.head(10)

                                                                            12000 +
  800
                                                  1000
```

#Print class freq. through pandas: we group the data by the column target and we count the number of rows
target_dist=data.groupby('failure').size()
print(target_dist)

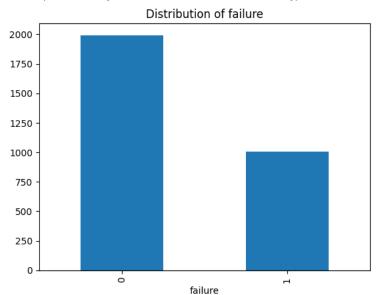

%matplotlib inline

#Visualize Class Counts
target_dist.plot.bar(x='',y='',title='Distribution of failure')

```
failure
0 1992
1 1008
```

dtype: int64

<AxesSubplot: title={'center': 'Distribution of failure'}, xlabel='failure'>

• the Distribution of failure above shows us that our cataset classes are noe well-balance so we will oversample the data in the next steps

Data Preparation

• We want to remove outliers in dataset using standard deviations technique in this section we remove every sample which its feature greater than 3 in STD

```
def remove_outliers(df,columns,n_std):
    for col in columns:
       print('Working on column: {}'.format(col))
       mean = df[col].mean()
       sd = df[col].std()
       df = df[(df[col] <= mean+(n_std*sd))]</pre>
   return df
data = remove_outliers(data,['vulc','perc_nat_rubber','weather','temperature','perc_imp','wiring_strength','elevation','perc_exp_comp'],3)
# data.failure.value_counts()
    Working on column: vulc
    Working on column: perc_nat_rubber
    Working on column: weather
    Working on column: temperature
    Working on column: perc_imp
    Working on column: wiring_strength
    Working on column: elevation
    Working on column: perc_exp_comp
```

 As you see before our dataset was not well balanced in classes, so it would be better to oversample it first and then using it in our machines

```
from sklearn.utils import resample
#Over-sample Minority Class
#1) Separate majority and minority classes
df_majority = data[data.failure==0] #"target" is the name of the target column, change it accordingly to your dataset
df_minority = data[data.failure==1] #"target" is the name of the target column, change it accordingly to your dataset
#2) Oversample minority class
df_minority_oversampled = resample(df_minority,
                                   replace=True,
                                   n samples=1900,
                                                      # number of samples into the minority class (change it accordingly to your dataset)
                                   random_state=123) # reproducible results
#3) Combine oversampled minority class with majority class
df_oversampled = pd.concat([df_minority_oversampled, df_majority])
#4) Display new class counts
df_oversampled.failure.value_counts() #"target" is the name of the target column, change it accordingly to your dataset
data = df_oversampled.copy()
data
```

	vulc	perc_nat_rubber	wiring_strength	weather	perc_imp	temperature	tread_type	tyre_season	elevation	month	tread_depth t
1677	16.384	33	0	0.37	0.02	-0.48	0	0	242.0	9	0
We seperte X , y from dataset X means our features and y means our labels											
	10 504 rop(['fa	ilure'],axis=1)	4	0.00	0.04	^ ^^	^	4	440.0	4	^
y = data.failure.values											

• One on the important thing before classification and every machine learning problem is Normalizing data, so we normalize the data in the next step

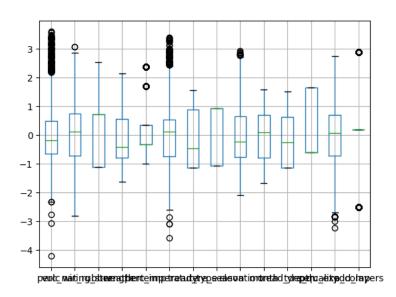

```
# Scale data from sklearn.preprocessing import StandardScaler scaler = StandardScaler().fit(X)
```

```
# We compute the scaler
scaled_data = scaler.transform(X.astype(float))
scaled_X = pd.DataFrame(scaled_data.astype(float))
scaled_X.columns = X.columns
```

```
scaled_tyres_test_data = scaler_tyres.transform(tyres_test.astype(float))
scaled_tyres_test = pd.DataFrame(scaled_tyres_test_data.astype(float))
scaled_tyres_test.columns = X.columns
```

```
# scaled_tyres_test.boxplot()
X = scaled_X.copy()
tyres_test = scaled_tyres_test.copy()
```

scaled_X.boxplot()

- · As you can see above our dataset is normalize now and we can use it in our machines
- · Now we seperate The data into Train and Test which we could use in our machine

```
#SPLIT DATA INTO TRAIN AND TEST SET

X_train, X_test, y_train, y_test = train_test_split(X, y, #X_scaled test_size =0.30, #by default is 75%-25% #shuffle is set True by default, stratify=y, random_state= 123) #fix random seed for replicability

print(X_train.shape)

(2683, 14)
```

SVM

- · We tried lots of machines and after all we decided to use SVM because it is more reliable and has more score from other ones
- · We use Grid Sreach for finding best parameters in SVM inputs and after finding best parameters we use them in our machines

```
#DEFINE YOUR CLASSIFIER and THE PARAMETERS GRID
from sklearn.svm import SVC
classifier = SVC()
parameters = {"kernel":['linear','rbf','polinomial'], "C":[0.1,1,100],"gamma":[1], "degree":[2,3,4]}
#DEFINE YOUR GRIDSEARCH
GS perfoms an exhaustive search over specified parameter values for an estimator.
GS uses a Stratified K-Folds cross-validator
(The folds are made by preserving the percentage of samples for each class.)
If refit=True the model is retrained on the whole training set with the best found params
from sklearn.model selection import GridSearchCV
gs = GridSearchCV(classifier, parameters, cv=3, scoring = 'f1', verbose=50, n_jobs=-1, refit=True)
#TRAIN YOUR CLASSIFIER
gs = gs.fit(X_train, y_train)
         Fitting 3 folds for each of 27 candidates, totalling 81 fits
          27 fits failed out of a total of 81.
         The score on these train-test partitions for these parameters will be set to nan.
          If these failures are not expected, you can try to debug them by setting error_score='raise'.
         Below are more details about the failures:
         5 fits failed with the following error:

accuracy macro avg weighted avg	0.88 0.88	0.87 0.87	0.87 0.87 0.87	1151 1151 1151

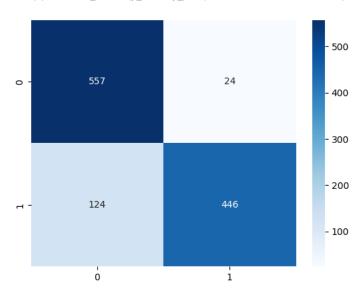

#CONFUSION MATRIX

from sklearn.metrics import confusion_matrix
print(confusion_matrix(y_test, y_pred))

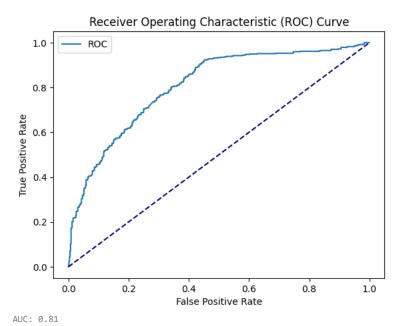

[[557 24] [124 446]]

Plot confusion matrix

sns.heatmap(confusion_matrix(y_test, y_pred), annot=True, fmt='d', cmap="Blues"); #annot=True to annotate cells fmt: format

```
from sklearn import metrics
model = SVC(C=0.1, gamma=0.0001, kernel='linear',probability=True)
model.fit(X_train, y_train)
y_pred = model.predict(X_test)
y_probs = model.predict_proba(X_test) #predict_proba gives the probabilities for the target (0 and 1 in your case)
fpr, tpr, thresholds=metrics.roc_curve(y_test, y_probs[:,1])
import matplotlib.pyplot as plt
plt.plot(fpr, tpr, label='ROC')
\verb|plt.plot([0, 1], [0, 1], color='darkblue', linestyle='--')|\\
plt.xlabel('False Positive Rate')
plt.ylabel('True Positive Rate')
plt.title('Receiver Operating Characteristic (ROC) Curve')
plt.legend()
plt.show()
auc = metrics.roc_auc_score(y_test, y_probs[:,1])
print('AUC: %.2f' % auc)
```

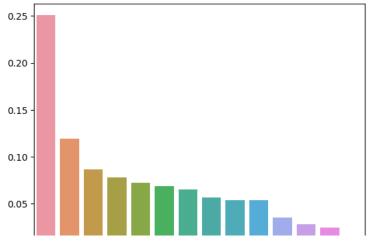

We use all 14 features in our machine. It would be better if we apply featurer selection technique to reduce size of the features. In that way
our machine would learn faster and better than using all 14 features.

Apply PCA

```
#PCA fit
from sklearn.decomposition import PCA
pca = PCA()
pca.fit(scaled_X)
df_pca = pd.DataFrame(pca.transform(scaled_X))

pca_tyres_test = PCA()
pca_tyres_test.fit(tyres_test)
df_pca_tyres_test = pd.DataFrame(pca_tyres_test.transform(tyres_test))

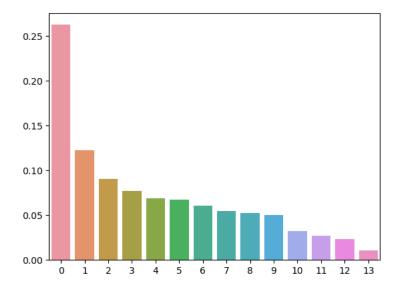

explained_variance=pd.DataFrame(pca.explained_variance_ratio_)
%matplotlib inline
import seaborn as sns
ax = sns.barplot( data=explained_variance.transpose())
```

explained_variance_tyres=pd.DataFrame(pca_tyres_test.explained_variance_ratio_)
%matplotlib inline

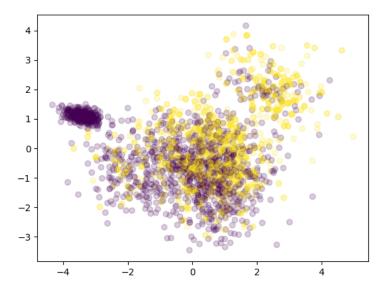

import seaborn as sns

ax = sns.barplot(data=explained_variance_tyres.transpose())

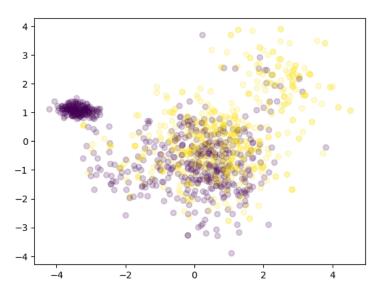

• Based on this plot I believe that the first 6 pca's are enough for choosing in our machine

pd.DataFrame(pca.components_,columns=X.columns)

```
{\tt import\ matplotlib.pyplot\ as\ plt}
```

```
x = X_test_pca.iloc[:,0]
y = X_test_pca.iloc[:,1]
plt.scatter(x, y,alpha=0.2,c=y_test )
plt.show()
```

Using 6 PC's for the Machines

```

#TEST ON YOUR TEST SET
best_model = gs.best_estimator_
y_pred = best_model.predict(X_test_pca.iloc[:,:6])
y_pred_train = best_model.predict(X_train_pca.iloc[:,:6])
y_tyres_test_result = best_model.predict(tyres_test_pca.iloc[:,:6])
#EVALUATE YOUR PREDICTION (on the y test that you left aside)
from sklearn.metrics import f1_score
print('***RESULTS ON TRAIN SET***')
print("f1_score: ", f1_score(y_train, y_pred_train))
print("--")
print('***RESULTS ON TEST SET***')
print("f1_score: ", f1_score(y_test, y_pred))
       ***RESULTS ON TRAIN SET***
       f1 score: 1.0
       ***RESULTS ON TEST SET***
       f1_score: 0.82666666666668
```

As you can see the f1 score in the test set data is 82.7% and in the train set is 100%, and I consider this as a final score of this project.
